

Front-end Developer - Take Home Test

The purpose of this take home test is to gauge your ability and familiarity with common duties required for modern front end development, including your understanding of basic API interaction, data manipulation and CSS skill level.

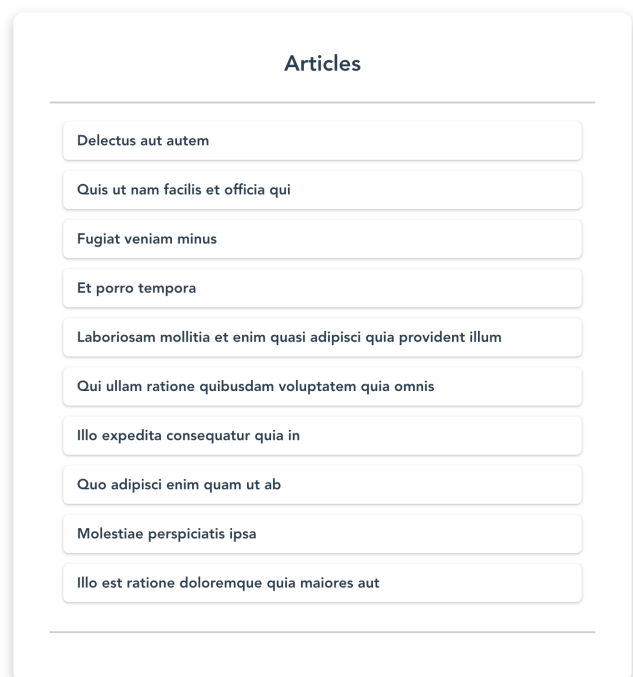

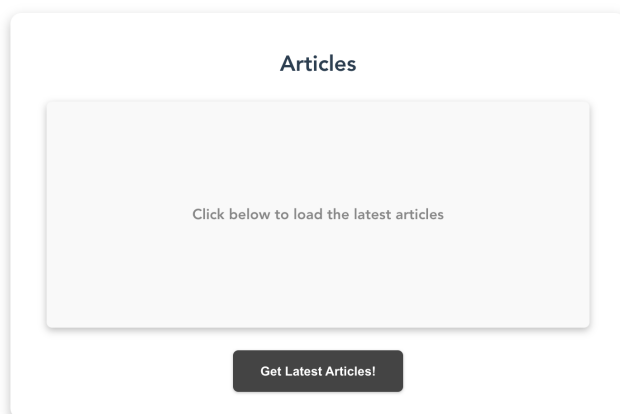

The following work should take anywhere between 1 and 4 hours to complete depending on your skillset and tools you choose to use to achieve this. This work must be committed to github and link to be provided once completed.

The goal here is to create a simple page with a button that when clicked, will retrieve and subsequently display a list of items from a 3rd party API.

A list of requirements are listed below:

- Use any technology you are comfortable with to achieve the end result.
- Use the following url to fetch list - <https://jsonplaceholder.typicode.com/todos>
- Display a list of ONLY 10 items on the page using the previously fetched data.

After this has been achieved, feel free to style the page how you want. An example can be seen below but feel free to style it however you like.

Bonus points for:

1. Adding a loading state while data is being fetched
2. Animating between states
3. Responsive styling
